
Content pdf (each test pdf has different folder by design atm)
Entire RAG process,
Script: RAG_main.py
Pdf parsed; Identify all elements pdf: text, tables, figures
Text, tables, and figures save in unique folders along with their metadata
Conduct docling hybrid chunking to chunk text, table with image place-holder
figures
VLM captures description of useful figures, using caption as guidance
Script: docling_parser.py
Functions: docling_scan_chunk_save
Append all chunks (include description of figures)
Save all chunks uniquely along with their metadata
Embedding chunks (turns chunk into vector)
Create vector database collection with qdrant
Qdrant database in qdrant/collections
Script: tem_database_setup.py
Functions: embedding, setup_qdrant_vecDB
Retrieve chunk based on query
Embedding (turn query into vector)
query
LLM
Save each test result uniquely, along with all the chunks used and their ranking by importance (mathematically)
Result markdown, chunks used and their importance ranking, with their metadata
END
